

MODEL: 250PS

SUBJECT: Guide Bar

When servicing the bar it should be noted that the bar is not a typical chain saw bar although it looks and function the same. The main difference is that the oil is fed thru a channel in the center lamination to the tip of the bar and fed to the chain from behind the roller tip. See illustration below.

Remember when servicing make sure that the gasket and o-ring are in place on the bar before tightening bar screws.
