SAFETY SPECIFICATIONS FOR POWER LAWN MOWERS

(Units with blade bolted directly to crankshaft)

The United States of America Standards Institute, (formerly American Standards Association), has issued the following Safety Standard. This standard (B71.16-1977, paragraph 10.3) specifies that "the maximum tip speed of any blade should be 19,000 feet per minute". Since blade tip speed is a function of engine R.P.M., lower tip speeds usually require lower engine speeds. The chart below lists various lengths of rotary lawnmower cutter blades, and the maximum blade rotational speeds, which will produce blade tip speeds of 19,000 feet per minute.

Blade Length	Maximum Rotational R.P.M.	Blade Length	Maximum Rotational R.P.M.
18"	4032	23"	3155
19"	3820	24"	3024
20"	3629	25"	2903
21"	3456	26"	2791
22"	3299		

For engine protection, top governed speed should never exceed 4000 R.P.M.

HIGHWHEEL & WIDE CUT - Engine RPM Full Throttle (No Load)
(Blades not bolted to crankshaft on these models)

22" - 3300 RPM
 26" - 3000 RPM

ELECTRIC CLUTCH TROUBLESHOOTING **BOLENS & TROY-BILT**

1. ELECTRIC PTO CLUTCH SPECIFICATIONS:

Voltage 12VDC
Resistance 3.2 Ohms
Current Draw 3.8 Amps

- b. Inspect engine driven attachment with clutch belt removed. Attachment should turn freely.
- c. Check clutch/brake pulley grooves for grease or oil.

2. CLUTCH DOES NOT ENGAGE -

- a. Check electrical system for broken wires or bad connections.

b. Check voltage at clutch lead. Voltmeter should read more than 10 volts. If voltmeter does not register a reading, look for broken wires or connect clutch lead and check resistance reading of clutch coil. A normal resistance reading should be between 3.0 and 2.3 ohms. A reading outside these values indicates a faulty coil. The field assembly should then be replaced. Check armature/rotor gap. This is done by inserting a feeler gauge in the four (f) slots provided in the brake flange. The gap should be between .010" - .015" (0.25mm-0.38mm) with the clutch/brake switch in the "off" position. If the gap is greater, tighten the (4) locknuts until they just contact brake flange. (CAUTION: Do not over torque locknuts as damage to brake flange may result.)

- d. Check clutch/brake working surfaces for grease or oil.

NOTE: REMOVE GREASE OR OIL FROM CLUTCH/ BRAKE WORK-

3. ENGINE DRIVEN ATTACHMENT ROTATES SLOWER THAN NORMAL -

- a. Check for loose belts.
